Observed response evidence

Shared local screenshots show POST /api/auth/register 201, POST /api/auth/login 200, profile 200 in terminal output, POST /api/blogs 201, GET /api/blogs 200, POST /api/ai/generate-blog 201, and POST /api/ai/summarize 200.

Observed timing examples

The screenshots display example request times: blog creation ~136 ms, blog list ~153 ms, AI generation ~10.47 s, and summarization ~4.95 s. These are individual local observations, not benchmark results.

Performance plan

Repeat requests in a documented environment and record sample size, concurrency, median/percentile latency, throughput, failure rate, dataset size, and Gemini model.

Dependencies

Separate MongoDB/API time from Gemini provider latency. AI timing varies with network and external service conditions.

Limitations

No load test, repeated benchmark, hardware/environment specification, or acceptance threshold was supplied; avoid generalizing from one screenshot.
